# Using decision trees for classification:

Fraction of points in region  $R_m$  from class  $k$ :

$$\hat{p}_{m,k} = \frac{\# \text{points in } R_m \text{ with label } k}{\# \text{points in } R_m}$$

$$= \frac{1}{N_m} \sum_{i: \underline{x}^{(i)} \in R_m} \mathbb{I} \{y^{(i)} = k\}$$

$$\hat{y}_m = \arg \max_k \hat{p}_{m,k}$$

# Decision trees

Tree building algorithm

Herman Kamper

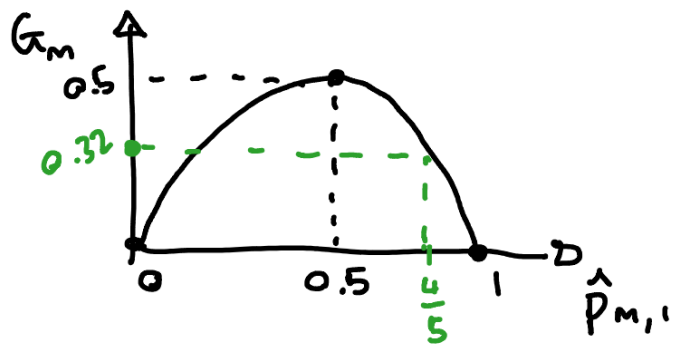

<http://www.kamperh.com/>

# Tree growing algorithm:

1. Start at top of tree (everything in) ↖ top-down
2. for each leaf node (region):  
for each feature  $x_j$  and split point  $s$ :  
Calculate reduction in leaf impurity
3. Choose best  $(j, s)$  combination to split;  
create new child nodes (regions) ← greedy
4. Repeat from (2) until stop condition is met ↖ recursive

Gini index: 
$$G_m = \sum_{k=1}^K \hat{p}_{m,k} (1 - \hat{p}_{m,k})$$

For two classes:  $\hat{p}_{m,1}$  &  $\hat{p}_{m,2}$   
$$\hat{p}_{m,2} = 1 - \hat{p}_{m,1}$$

Classification error rate:

$$E_m = 1 - \max_k \hat{p}_{m,k}$$
